

**Capable Open Source Robotics**  
**<https://mjbots.com>**

# About Josh (me)

I'm an engineer who is passionate about robotics!

I've been working in the commercial robotics space since graduating in 2004, and hobbying for more than a decade before that.

**Update**

# mjbots Robotic Systems

Founded in 2018, mission statement:

“Allow researchers and enthusiasts to create world changing robotic systems with capable, affordable products and top quality support”

# Open Source Software (and most hardware)

All of the firmware and software used in every mjbots product is licensed under the Apache 2.0 License.

All of the PCB designs are as well!

This means that you can not only study the software and PCB designs to understand how they work, but you can directly incorporate them into your work, even if you commercialize it -- with no royalties!

# Products

# Product focus

Mjbots products are designed to encompass many of the components you need to build a dynamic, high performance robotic system:

- Brushless motor controllers
- High speed and low latency CAN-FD adapters
- Power conditioning and filtering
- Integrated servo drives

# moteus brushless motor controller

- Same basic function and control performance as the MIT Mini-Cheetah controller:
  - Integrated absolute magnetic encoder
  - 3 phase current/torque sensing
  - 40kHz FOC based control
- ... with many enhancements
  - STM32G4 based
  - 100A peak phase current, 44V peak voltage
  - 5Mbps CAN-FD communication
  - Auxiliary I2C encoder for post-gearbox sensing
  - More comprehensive firmware
  - GUI for diagnostics and configuration

# moteus brushless motor controller

- Same basic function and control performance as the MIT Mini-Cheetah controller:
  - Integrated absolute magnetic encoder
  - 3 phase current/torque sensing
  - 40kHz FOC based control
- ... with many enhancements
  - STM32G4 based
  - 100A peak phase current, 44V peak voltage
  - 5Mbps CAN-FD communication
  - Auxiliary I2C encoder for post-gearbox sensing
  - More comprehensive firmware
  - GUI for diagnostics and configuration

# pi3hat

- Multi-purpose Raspberry Pi 4 (and 3) robot controller
  - Power source for Raspberry Pi, accepts up to 44V input
  - 5x independent CAN-FD channels (up to 8Mbps each)
  - 1kHz IMU with built-in UKF based attitude solution
  - Port for nrf24l01 RF transceiver

# pi3hat

- Multi-purpose Raspberry Pi 4 (and 3) robot controller
  - Power source for Raspberry Pi, accepts up to 44V input
  - 5x independent CAN-FD channels (up to 8Mbps each)
  - 1kHz IMU with built-in UKF based attitude solution
  - Port for nrf24l01 RF transceiver

# power\_dist

- Pre-charge, soft switch, and fault detection
  - 44V input
  - 45A continuous, 80A peak current
  - 6x XT30 output connectors
  - 4000uF max downstream capacitance
  - 300uA quiescent draw when off

# qdd100

- High torque, low mass quasi-direct drive brushless servo
  - Peak torque: 16Nm
  - Maximum speed @36V: 3,700dps (616rpm)
  - Mass: 485g
  - Powered by an integrated moteus controller
  - Fully supported by bearings, can directly support large robot mass with cantilevered output

# qdd100

- High torque, low mass quasi-direct drive brushless servo
  - Peak torque: 16Nm
  - Maximum speed @36V: 3,700dps (616rpm)
  - Mass: 485g
  - Powered by an integrated moteus controller
  - Fully supported by bearings, can directly support large robot mass with cantilevered output

# quad A1

- 12 DoF quadrupedal robot
- 10kg mass (with battery)
- 2.5m/s maximum speed
- 50 min battery life
- Chassis nearly entirely 3D printed with design files public
- Multiple interface options
  - Wifi with HTML/JS UI
  - JSON/Websocket interface for programmatic command and monitoring

Speed: 1.4 m/s - 10% slow motion

# Getting started kits

Both the moteus controller and qdd100 have “developer kits”, which include everything necessary to make things move out of the box.

No extra parts or cable building required!

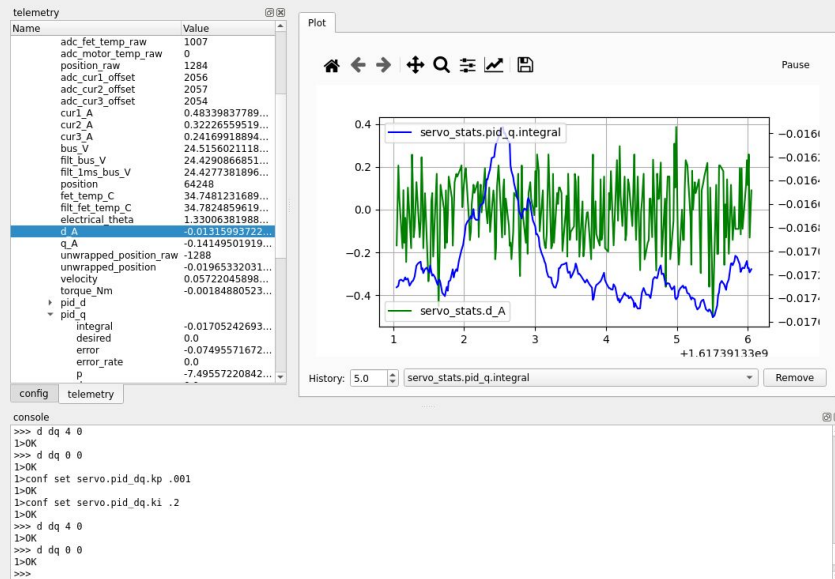

The image features a light gray background with two large, solid red geometric shapes in the corners. One shape is in the top right corner, and the other is in the bottom left corner. Both shapes are composed of a square with a diagonal cut, creating a triangular void. The text "Software and Support" is centered in the middle of the image.

# Software and Support

# Client libraries

- moteus and qdd100 have pure python and C++ libraries available
- The “tview” diagnostic tool lets you interactively modify configuration and inspect the state of the devices

# github

Each of the various products has a distinct github repository with source and issues:

- moteus: <https://github.com/mjbots/moteus>
- pi3hat: <https://github.com/mjbots/pi3hat>
- power\_dist: [https://github.com/mjbots/power\\_dist](https://github.com/mjbots/power_dist)
- quad A1: <https://github.com/mjbots/quad>

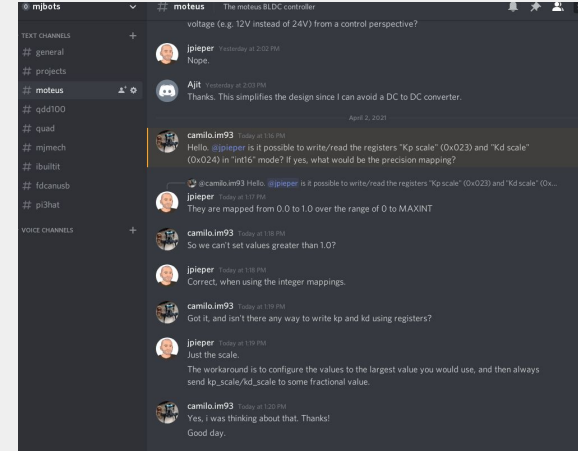

# Discord

24/7 community and mjbots provided support via a Discord server:

<https://discord.gg/W4hUpBb>

Questions, debugging, application engineering, and feature requests are all welcome.

Demonstration applications are typically turned around within a few days.

# Worldwide reach

Customers on 5 continents (here's looking at you Africa and Antarctica!)

The image features a light gray background with four red geometric shapes in the corners. Each shape is a right-angled triangle with a diagonal cut, creating a trapezoidal effect. The top-left and bottom-right shapes are oriented towards the center, while the top-right and bottom-left shapes are oriented away from the center.

# Public projects

# Stanley quadruped

# bstrip

# y2Iso

## 3d printed actuators

**Thank you!**
